

## PhD Candidate Profile

### Name:

Pedro Luis Sanabria Florez

### Research Group (if relevant):

Grupo de pesquisa em metodologias analíticas e processos avançados-GMAPS

### Research Centre (if relevant):

N/A

### Department/School(s) (if relevant):

Instituto de Química - Dep. de Química Inorgânica

### College:

Universidade Federal do Rio Grande do Sul

### Supervisor(s):

Dr. Carla Sirtori

### Funding body:

Coordenação de Aperfeiçoamento de Pessoal de Nível Superior (CAPES-Brazil)

### Area (field) of study:

Removal of emerging contaminants in water by advanced oxidation processes

### Thesis Title:

Chemotherapics degradation by Fenton and photo-Fenton solar processes in neutral pH: identification of processing products and risk assessment.

### Abstract:

Chemotherapics are widely used micro-pollutants in the treatment of breast cancer. Given their high consumption these chemicals end up being present in the domestic and hospital effluent, which if not treated by efficient processes.

In this work we study the application of the advanced oxidation process (solar photo-Fenton) for the degradation of chemotherapics in hospital effluent, simulated effluent water and distilled water. As wastewater treatment plants are unable to completely eliminate compounds (emerging contaminants) it is necessary to treat effluents.

The degradation will allow the evaluation of the kinetic study of the degradation of the compounds, as well as the identification of potential transformation products generated using high resolution exact mass techniques. Finally, after the total degradation of chemotherapics the reuse of treated water will be evaluated. Another section of the research will be risk evacuation using the QSARs model.
